Schema:

Documentation

1. Entities & Attributes

Passenger

PassengerID (PK): Unique identifier for each passenger.

FullName (Composite: FirstName, LastName): Passenger's full name.

Email: Passenger's email address.

PhoneNumber (Multivalued): One or more phone numbers.

Reservation

ReservationID (PK): Unique identifier for each reservation.

BookingDate: Date when the reservation was made.

SeatNumber: The seat assigned to the passenger.

PassengerID (FK): References the passenger who made the reservation.

FlightID (FK): References the flight associated with the reservation.

Ticket (Weak Entity)

ReservationID (PK, FK): References the reservation (part of composite key).

TicketNumber (Partial Key): Distinguishes tickets under the same reservation.

IssueDate: Date when the ticket was issued.

Price: Ticket price.

Flight

FlightID (PK): Unique identifier for each flight.

FlightNumber: Airline flight code/number.

Departure (Composite: DepartureDate, DepartureTime): Departure information.

Arrival (Composite: ArrivalDate, ArrivalTime): Arrival information.

DepartureAirportID (FK): References the airport of departure.

ArrivalAirportID (FK): References the airport of arrival.

Airport

- AirportID (PK): Unique identifier for each airport.

AirportName: Name of the airport. - Location (Composite: City, Country): Location details of the airport.

Payment

- PaymentID (PK): Unique identifier for each payment.

PaymentDate: Date of the transaction. Amount: Total amount paid. - Method: Payment method (Credit Card, Cash, etc.).

ReservationID (FK): References the reservation being paid.

2. Relationships & Cardinalities

1. Passenger – makes – Reservation (1 : M): One passenger can make many reservations, but each reservation belongs to exactly one passenger. 2. Reservation – has – Ticket (Identifying, 1 : M): One reservation can contain multiple tickets. Ticket is a Weak Entity, dependent on Reservation. 3. Flight – has – Reservation (1 : M): One flight can have multiple reservations, but each reservation is for one flight only. 4. Flight – departs from – Airport (M : 1): Multiple flights can depart from the same airport, but each flight departs from exactly one airport. 5. Flight – arrives at – Airport (M : 1): Multiple flights can arrive at the same airport, but each flight arrives at exactly one airport. 6. Reservation – paid by – Payment (1 : 1 or 1 : M): One reservation can have one or multiple payments, depending on whether partial payments are allowed.

3. Assumptions

Each passenger must have a unique PassengerID.

A reservation cannot exist without both a Passenger and a Flight. - Tickets cannot exist independently and are tied to a reservation.

Each flight must have exactly one departure airport and one arrival airport. - A payment is always linked to a reservation, and no orphan payment can exist.

PhoneNumber is multivalued since a passenger may have multiple contact numbers.

FullName, Location, Departure, and Arrival are composite attributes for clarity and normalization.
